## ABSTRACT OF THE DISCLOSURE

A mechanism for validating a message, such as an XML message or other hierarchicallyorganized content. A validation engine walks through the tree represented by the message
preferably in depth-first traversal order. Upon encountering each node in the tree, the validation
engine consults a validation table to identify a delegate that is to be invoked. The validation engine
then invokes the delegate identified for that node, and calls itself recursively on the subtrees of the
current node. After the subtrees have been processed, the validation engine again consults the
validation table to identify a post-handler for the current node, and then invokes the post-handler.
An entry in the validation table may be flagged as "exclusive" to prevent traversal of subtrees of the
node corresponding to that entry. Additionally, there may be both global and local validation tables,
where the global table is used when a node has no entry in the local table.
